

# CareerHub — Design System

Glassmorphism UI, motion, and layout spec for web + browser extension

This document defines the visual identity for CareerHub: a calm, glass-panelled interface that feels premium and trustworthy (you're handing it your resume and personal data), works cleanly across mobile and desktop, and gives the browser extension the same visual DNA as the website.

## 1. Design Direction & Rationale

Most glassmorphism today defaults to pastel gradients on white — pretty, but it makes the glass barely visible and feels decorative rather than functional. CareerHub inverts that: a **deep space-navy base** so translucent panels actually read as glass, with a single ambient indigo-violet glow behind the hero content and a mint-teal accent reserved for progress and success states (ATS score, application tracked, profile complete). This ties the aesthetic to the product's actual job — helping someone track progress through an anxious process — rather than decorating it.

**Signature element:** the hero features a tilted glass resume card with a live-animating ATS score ring that fills from 0 to 82% on page load. It's the one bold, memorable moment; everything else in the interface stays quiet and disciplined around it.

## 2. Color Palette

Core tokens — 6 named colors, each with a specific job:

|               |                    |                |
|---------------|--------------------|----------------|
| Base / Navy   | Primary / Indigo   | Success / Teal |
| #0B1020       | #5B4FE8            | #2FDDC4        |
| Alert / Amber | Glass Tint (light) |                |

#F5A623

#E8EAF6 8-14% opacity

#FFFFFF

Glass panels: white at 8-14% opacity, 1px border white at 15-18% opacity, backdrop-blur of 20-28px, subtle inner highlight (1px white line, top edge only, 40% opacity) to sell the "pane of glass" edge. On light backgrounds (e.g. print/export views, or a future light-mode toggle), invert to navy-tinted glass on off-white (#F3F4FA) rather than pure white glass.

### 3. Typography

| Role                | Typeface & Weight                            | Usage                                                                                                                                 |
|---------------------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Display (headings)  | Clash Display or General Sans, Semibold/Bold | Geometric, confident, used sparingly — H1/H2 and the hero only.                                                                       |
| Body                | Inter, Regular/Medium                        | Neutral, highly legible at small sizes for dense tool UIs and forms.                                                                  |
| Data / Mono accents | JetBrains Mono, Regular                      | Used only for scores, percentages, and status tags (e.g. "ATS 82%", "3 fields left") — signals "this is a live tool," not a brochure. |

Type scale (desktop): H1 40-48px / H2 28px / H3 20px / Body 16px / Caption 13px / Mono data 14px. Scale down proportionally on mobile: H1 28-32px, H2 22px, Body stays 16px (never shrink body text below 16px on mobile — it's a form-heavy product, legibility matters more than density).

## 4. Layout — Landing / Home Page

### Desktop hero (wireframe):

```
+-----+
| [Logo] Tools Extension Pricing [Sign in] [Get Started] |
| |
| Every resume & job-application .----- . |
| tool, in one place. / glass \ |
| | resume | |
| Build, check, and auto-fill -- | card, | |
| without 8 different tabs open. | tilted, | |
| | ATS ring| |
| [ Build my resume ] [ Check ATS score ] \ 0->82% / |
| '-----' |
| trusted-by strip: college logos / user count |
+-----+
```

The hero glass card sits slightly rotated (2-4deg) with a soft drop shadow and the ambient indigo glow behind it. On scroll, it gently de-rotates to 0deg (a small, purposeful motion, not a gimmick).

### Tools grid (glass cards):

```
+-----+ +-----+ +-----+ +-----+
| [icon] | | [icon] | | [icon] | | [icon] |
| Resume | | ATS Checker | | Cover | | Auto-Fill |
| Builder | | | Letter | | Extension |
| glass card | | glass card | | glass card | | glass card |
+-----+ +-----+ +-----+ +-----+
```

Each card: glass background, 20px radius, icon top-left in a small teal-tinted glass chip, title + one line description, hover state lifts the card 4px with a slightly stronger blur and a thin indigo border glow (desktop only — replaced by a tap-scale of 0.98 on mobile/touch).

### Mobile layout:

```
+-----+
| [Logo] [menu]≡ |
| |
| tilted glass card |
| (resume + ATS ring) |
| |
| Build, check, autofill |
| [ Build my resume ] |
| [ Check ATS score ] |
|-----|
| Tools (stacked, full- |
| width glass cards, |
| one per row) |
+-----+
```

Single column, full-width glass cards, sticky bottom action bar on tool pages ("Save" / "Download") so primary actions never require reaching the top of a tall form on a phone.

## 5. Responsive Behavior

---

| Breakpoint          | Behavior                                                                                                                                                 |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Desktop (>=1024px)  | Multi-column grids (3-4 cards/row), hover states active, sidebar navigation for dashboard/tracker.                                                       |
| Tablet (600-1023px) | 2-column grids, hover states replaced with tap-scale feedback, collapsible sidebar.                                                                      |
| Mobile (<600px)     | Single column, sticky bottom action bar for primary CTAs, hamburger nav, backdrop-blur reduced to 12-16px (mobile GPUs render heavy blur less smoothly). |

*Always provide a reduced-motion fallback: if the OS "reduce motion" setting is on, replace tilt/parallax and score-ring animation with an instant, static state.*

## 6. Motion & Animation Spec

| Moment                                    | Animation                                                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Page load (hero)                          | Glass resume card fades + tilts in (400ms, ease-out); ATS ring animates 0 -> 82% over 900ms once card settles.        |
| Card hover (desktop)                      | Lift 4px + border glow, 150ms ease. No hover-only content (must work identically on touch).                           |
| Scroll reveal                             | Sections fade + rise 12px into place, staggered 60ms per card, triggered once per section (not on every scroll pass). |
| Form field focus                          | Border transitions from white/15% to indigo/60%, label micro-shrinks upward (Material-style float), 120ms.            |
| Autofill success (web + extension)        | Filled fields briefly flash a soft teal highlight (400ms fade), so the user visually confirms what changed.           |
| Loading/generating (AI rewrite, ATS scan) | Skeleton glass shimmer, not a spinner — keeps the "glass" material consistent even in loading states.                 |

Rule of thumb: one orchestrated moment (the hero) earns to be elaborate; everything else should be quick (under 200ms) and purposeful — confirming an action, not decorating it.

## 7. Browser Extension — Visual & Interaction Design

The extension inherits the same glass-on-navy language at a smaller scale, so switching between the website and the extension popup feels like the same product, not a bolted-on add-on.

### Extension popup (clicked from browser toolbar):

```
+-----+
| CareerHub [x] | <- glass panel, navy bg,
|-----| compact 340x420px
| Detected: Naukri.com |
| [teal dot] Portal recognized |
| |
| Profile: Dhanush K. |
| [ Use this profile v] |
| |
| 14 fields detected |
| [===== USE =====] | <- big glass CTA button,
| | indigo, glowing edge
| Last used: 2 days ago |
+-----+
```

### Interaction flow when user clicks "Use":

- **1. Detect:** On page load of a supported portal, the extension icon shows a small teal badge/dot — signals "this page is fillable" before the user even clicks anything.
- **2. Click extension icon:** Popup opens with the glass panel shown above — portal name, matched profile, and a field count ("14 fields detected") so the user knows what will happen before committing.
- **3. Click "Use":** Popup closes; on the actual job-portal page, each field fills in sequence (staggered ~40ms apart, not all at once) with a soft teal highlight-and-fade — this sequential fill is both a delight moment and reassurance that it's really working, not a silent instant swap that feels suspicious.
- **4. Inline confirmation chip:** A small floating glass chip appears bottom-right of the page: "12 of 14 fields filled - 2 need your review" with a subtle pulse on unmapped fields (e.g. a field the extension wasn't confident about) so the user's eye is drawn there before submitting.
- **5. Manual review:** User reviews and clicks the portal's own Submit button — CareerHub never auto-submits.
- **6. Learn unmapped fields:** If a field is flagged, user can click it, pick which profile field it maps to from a small glass dropdown, and that mapping is remembered for next time on that portal.

### Toolbar icon states:

| State                      | Visual                                                              |
|----------------------------|---------------------------------------------------------------------|
| Default (unsupported page) | Grey monochrome icon — no distraction on pages where it can't help. |
| Portal recognized          | Full-color icon + small teal dot badge.                             |
| Fill in progress           | Icon briefly pulses (loading ring) while fields populate.           |
| Needs review               | Small amber dot badge if any fields couldn't be auto-mapped.        |

## 8. Key Component Notes

---

- **Buttons:** Primary = solid indigo with soft outer glow, 12px radius. Secondary = glass (transparent + border) so it recedes next to primary actions. Never more than one primary button visible per screen.
- **Forms:** Glass input fields on navy sections, solid white/light-navy fields on light sections for contrast; always visible focus ring (accessibility) even though the aesthetic is soft.
- **Score rings / progress:** Teal for good (70%+), amber for medium (40-69%), soft red-coral for low (<40%) — consistent traffic-light logic reused across ATS score, profile completeness, and application tracker stage.
- **Icons:** Single-weight line icons (not filled), 1.5px stroke, rounded joins — matches the soft glass aesthetic better than sharp geometric icon sets.
- **Empty states:** Illustrated with the same glass-card motif at low opacity plus one direct action ("No resumes yet — Build your first one"), never just blank space.

---

*Next step: turn Section 4 and 7 into clickable Figma frames or a coded prototype (React/Tailwind) once you're ready to test this with a few real users.*
